Week 1: Acid shortage and a Caspian detour define Kazatomprom’s context

Weekly evidence artifact · Week 1 · Trimester 1, 2026

1. Theory anchor

PESTLE macro-environment scan [10].

2. Artifact

Factor	Finding
Economic / supply	Domestic sulfuric acid shortage led Kazatomprom to lower 2025 production expectations [8]
Political / trade	About 48% of 2025 Western deliveries moved to the TITR [9]
Legal	Subsoil Code limits groundwater risk [7]

3. Company A vs. Company B insight

Cameco faces hard-rock geology and Canadian rail; Kazatomprom faces acid supply and corridor risk. Cameco’s 2023 report shows an Inkai shipment delayed into Q4 [3].

4. Transfer verdict

Adapt. Cameco’s inventory-buffer habit fits, but the context is different.

5. Evidence + verification

Acid shortage [8]; 48% TITR share [9]. Checked against company and news reports; the 48% is a reported share, not my own calculation.

6. Mini-recommendation

The Commercial Director should map acid and corridor risks quarterly; progress signal: a risk list reviewed every quarter.

7. Learning progression & AI disclosure

I started by thinking about uranium prices. The evidence showed that supply chains and rules matter more. AI helped me organise the PESTLE table; I wrote the findings.

Companies: Cameco (A) and NAC Kazatomprom JSC (B). Source numbers [n] refer to the Evidence page of the ePortfolio.
Proposed targets and thresholds are design assumptions and pilot targets, not verified Kazatomprom data.
