Week 6: Delivery reliability, not price, wins utility customers

Weekly evidence artifact · Week 6 · Trimester 1, 2026

1. Theory anchor

B2B customer journey mapping [10].

2. Artifact

Step	Human only	AI-supported
Order and contract	Terms, renegotiation	—
Shipment tracking	Final ETA confirmation	ETA prediction across rail, Caspian weather, customs
Delay handling	Customer calls	Alert if ETA variance above 24 h

3. Company A vs. Company B insight

Cameco’s Inkai delay, where only two-thirds arrived in Q4 [3], shows why customers need early warning.

4. Transfer verdict

Adapt Cameco-style rail tracking to the multi-border TITR.

5. Evidence + verification

TITR share [9]; delay case [3]. Target: 10 days shorter European transit, a **proposed target**, not an observed result.

6. Mini-recommendation

The Logistics Officer should check every AI ETA with variance above 24 h; progress signal: ETA error tracked monthly.

7. Learning progression & AI disclosure

I thought marketing meant promotion. For uranium it means trustworthy delivery. AI helped with the journey layout; the evidence selection is mine.

Companies: Cameco (A) and NAC Kazatomprom JSC (B). Source numbers [n] refer to the Evidence page of the ePortfolio.
Proposed targets and thresholds are design assumptions and pilot targets, not verified Kazatomprom data.
